

Docket No. 503.35255VX6  
Serial No. 10/600,617  
April 10, 2006

**AMENDMENTS TO THE CLAIMS:**

The following listing of claims replaces all prior listings, and all prior versions, of claims in the application.

**LISTING OF CLAIMS:**

1. and 2. (Cancelled).

3. (Currently amended) A hollow frame member according to claim 132, wherein said recessed portion is provided at a connection portion of said third plate and said one end of said first plate.

4. (Cancelled).

5. (Currently amended) A hollow frame member according to claim 14[[4]], wherein said corner portion is positioned at saidan extension line of a center in said thickness of said third plate.

6. (Currently amended) A hollow frame member according to claim 14[[4]], wherein said corner portion is positioned at another end side of said first plate from a center in said thickness of said third plate.

7. (Cancelled).

8. (Currently amended) A hollow frame member according to claim 157, wherein said second recessed portion is provided at a connection portion of said third plate and said one end of said second plate.

Docket No. 503.35255VX6  
Serial No. 10/600,617  
April 10, 2006

9. (Currently amended) A hollow frame member according to claim 8,  
wherein:

—said third plate is formed substantially orthogonal to said second plate, and  
a second corner portion from said second plate to said second recessed  
portion is positioned in said range of said extension line in said thickness of said  
third plate.

10. (Currently amended) A hollow frame member according to claim 9,  
wherein said second corner portion is positioned at said extension line of a center  
in said thickness of said third plate.

11. (Currently amended) A hollow frame member according to claim 9,  
wherein said second corner portion is positioned at another end side of said second  
plate from said center in said thickness of said third plate.

12. (New) A member adapted to be used in friction stir welding,  
comprising:

in one end of said member, in one outer face in a thickness direction of said  
member and another outer face in said thickness direction of said member, recessed  
portions are provided respectively,

said recessed portion of said one outer face opens directed toward one outer  
side in said thickness direction of said member and one end direction of said  
member, and is defined by one substantially vertical surface facing outwardly

Docket No. 503.35255VX6  
Serial No. 10/600,617  
April 10, 2006

laterally to said thickness direction of said member and by one substantially horizontal surface facing in said thickness direction of said member,

    said recessed portion of said another outer face opens directed toward another outer side in said thickness direction of said member and said one end direction of said member, and is defined by another substantially vertical surface facing outwardly laterally to said thickness direction of said member and by another substantially horizontal surface facing in said thickness direction of said member,

    said one substantially horizontal surface facing outwardly in said thickness direction of said member is positioned in a range of a plate thickness of said member,

    said another substantially horizontal surface facing outwardly in said thickness direction of said member is positioned in a range of a plate thickness of said member,

    said respective recessed portions are portions capable of having a friction stir welding carried out therein by inserting a rotary tool therein,

    a center of said rotary tool is substantially coincided with an extension line of said one substantially vertical surface facing outwardly laterally to said thickness direction of said member, and

    said center of said rotary tool is substantially coincided with an extension line of said another substantially vertical surface facing outwardly laterally to said thickness direction of said member.

13. (New) A hollow frame member adapted to be used in friction stir welding, comprising:

Docket No. 503.35255VX6  
Serial No. 10/600,617  
April 10, 2006

said hollow frame member comprises a first plate, a second plate which is substantially in parallel to said first plate, and a third plate for connecting one end of said first plate and one end of said second plate, said third plate being substantially perpendicular to said first plate and substantially perpendicular to said second plate,

at a side of an outer face of said one end of said first plate, a recessed portion is provided along to said one end of said first plate,

said recessed portion opens directed toward one outer side in said thickness direction of said member and one end direction of said member, and is defined by a substantially vertical surface facing outwardly laterally to said thickness direction of said member and by a substantially horizontal surface facing in said thickness direction of said member,

said substantially horizontal surface facing outwardly in said thickness direction of said hollow frame member is positioned in a range of a plate thickness of said hollow frame member,

said recessed portion is a portion capable of having a friction stir welding carried out therein by inserting a rotary tool therein, and

a center of said rotary tool is substantially coincided with an extension line of said substantially vertical surface facing outwardly laterally to said thickness direction of said hollow frame member.

14. (New) A hollow frame member according to claim 3, wherein a corner portion from said first plate to said recessed portion is positioned in said range of said extension line in said thickness of said third plate.

Docket No. 503.35255VX6  
Serial No. 10/600,617  
April 10, 2006

15. (New) A hollow frame member according to claim 13, wherein:

at said one end of said first plate, a second recessed portion is provided in  
said second plate along to said one end,

said second recessed portion opens directed toward an outer side in a  
thickness direction of said hollow frame member and said one end direction of said  
hollow frame member, and is defined by a further substantially vertical surface facing  
outwardly laterally to said thickness direction of said hollow frame member and by a  
further substantially horizontal surface facing in said thickness direction of said  
hollow frame member,

said further substantially horizontal surface facing outwardly in said thickness  
direction of said hollow frame member is positioned in a range of a plate thickness of  
said hollow frame member,

said second recessed portion is a portion capable of having a friction stir  
welding carried out therein by inserting a rotary tool therein, and

a center of said rotary tool is substantially coincided with an extension line of  
said further substantially vertical surface facing outward laterally to said thickness  
direction of said hollow frame member.
